

DRAFT Highett Urban Forest Precinct Plan 2023

Introduction to the Precinct Plans

In December 2019, Bayside City Council declared a climate emergency and has since prepared a *Climate Emergency Action Plan 2020 – 2025*. Climate change is real and without respecting our environment or changing the way we behave as a society, there will be even greater impacts than those already experienced. Expanding Bayside's urban forest is one way that we can help cool the urban environment in which our residents live.

As an action listed in the *Climate Emergency Action Plan*, the development of the Bayside *Urban Forest Strategy* was undertaken and ultimately adopted at its February 2022 Council Meeting. In addition, Bayside City Council has endorsed *Living Melbourne: Our Metropolitan Urban Forest* in 2019, which sets out regional targets for tree and vegetation canopy cover to be reached by 2030, 2040 and 2050.

The Vision of the Bayside Urban Forest Strategy is:

"Bayside's urban forest will protect and restore ecological systems with special concern for biological diversity and natural processes which will create a cooler and greener Bayside with enhanced amenity and character where people are connected to nature."

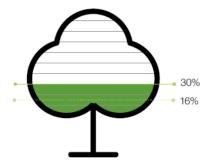

The overarching goal of the Bayside Urban Forest Strategy is to increase the urban tree canopy cover from the current 16.01% to 30% by 2040, and to continue this increase into the future.

The Bayside *Urban Forest Strategy* identifies a range of actions to be undertaken over the next four years. A key focus is the preparation of Precinct Plans for each suburb in Bayside to guide tree planting and greening at a local level. Precinct Plans are subsidiary documents to the Bayside *Urban Forest Strategy* and form a key component of the strategy's implementation. Bayside is made up of 9 suburbs and the Urban Forest Precinct Plans will be prepared for each. They will provide tailored direction for increasing canopy cover and urban forest outcomes into the future.

What is an urban forest?

The urban forest encompasses all the trees, shrubs, grasslands, other vegetation and the soil and water that support them – within Bayside, on both public and private land. The urban forest incorporates vegetation in streets, parks, gardens, plazas, campuses, river and creek embankments, wetlands, railway corridors, community gardens, home gardens, green walls, balconies, and roofs. Fauna is an important component too, with complex interrelations between animals and plants helping to maintain the urban forest.

Bayside's urban forest is made up of native, indigenous and exotic trees, shrubs, grasslands and other vegetation, growing on public and private land, and the soil and groundwater that support them. This includes vegetation in parks, reserves, private gardens, along railways, waterways, main roads, and local streets, and on other green infrastructure such as green walls and roofs. The urban forest provides habitat to a wide range of fauna.

The overarching goal of the Urban Forest Strategy in Bayside is to increase the urban tree canopy cover from the current 16.01% to 30% by 2040, and to continue this increase into the future.

¹ Resilient Melbourne, Living Melbourne Strategy, 2018, available at: https://resilientmelbourne.com.au/wp-content/uploads/2019/09/LivingMelbourne Strategy online3.pdf

The Urban Forest Strategy	
Principles:	Strategies:
1. Increase	 1.1 Consider the individual needs of Bayside's suburbs and ensure that the approach to increasing canopy cover and urban forest outcomes is tailored to the conditions of each area. 1.2 Reframe Council's approach to major capital and infrastructure renewal projects as opportunities to increase urban forest outcomes.
	1.3 Through the Bayside Planning Scheme, require development to provide increases to the number of canopy trees provided.
2. Healthier ecosystems	2.1 Increase the tree and vegetation canopy cover that is of a diverse range of species across Bayside.
	2.2 Ensure humans and wildlife can simultaneously and safely access densely vegetated areas, streets and reserves.
3. Monitor	3.1 Improve, implement and facilitate Council processes and procedures to assist the monitoring of the urban forest
4. Maintain	4.1 Ensure the tree removal process is transparent and equitable
4. Mairitairi	4.2 Reframe our planning and policy framework to give greater priority to existing trees and vegetation when siting new development and ensuring the longevity of any new trees or vegetation by ensuring it is appropriately sited nearby surrounding hard surfaces or infrastructure.
	4.3 Enhance Council's ability to retain existing trees on private property through increased regulation of tree removal.
	4.4 Support the maintenance and retention of trees on public land.
5. Learn and Celebrate	5.1 Increase Council's capacity to provide advice and build community
	sentiment to tree planting in Bayside. 5.2 Continue to build upon Council's green image and utilise this platform to advocate and partner with key stakeholders to provide greener outcomes across Bayside, metropolitan Melbourne and Victoria.
	5.3 Leverage from the strengths of our network of volunteers, community groups, State Government departments, neighbouring local governments, academics and professionals to support the delivery of community education, information sharing and creating partnerships.

Key Issues

Environmental challenges

Impact of climate change: All trees, including trees on private property, are being affected by climate change. It is important that Council continues to encourage residents to plant climate-resilient trees and vegetation on their property and nature strips. To support this, the provision of readily accessible information and useful tips on how to best plant these types of trees and vegetation will be of great value. Council will also ensure its species palette for streets and parks include the use of more climate-resilient trees and vegetation.

Tree health, age, Useful Life Expectancy, and species diversity: The Bayside Urban Forest Strategy defines key issues across Bayside's urban forest, including climate change, insufficient growth space and natural characteristics (disease, insects, etc.) being significant contributing factors to the health and sustainability of tree coverage across Bayside. This Precinct Plan identifies locations of trees that are in poor health, are reaching senescence and has low useful life expectancy so that appropriate action can be taken in due time.

Tree survival rate: A high proportion of street and park trees that have been planted have struggled to survive either during or after their initial period of maintenance (first 2 years). Expanding the urban forest and increasing tree canopy coverage will be challenging, especially if high tree attrition continues to occur.

Developmental challenges:

Trees on private property: Trees on private property make up a significant proportion of Bayside's urban forest. The removal of trees on private property is a significant and challenging issue to address as the management of private trees, to some extent, falls into the hands of individual property owners. Partnering with the private owners and undertaking a precinct-based approach to the protection, retention and enhancement of the urban forest will allow Council to consider the local opportunities for vegetation and tree plantings, process improvements and other locally specific issues.

Planning permits involving vegetation removal:

There are several mechanisms currently in place within the Bayside Planning Scheme that seek to protect vegetation in certain areas of Bayside and require a planning permit to be granted for tree or vegetation removal. These mechanisms include but are not limited to the Vegetation Protection Overlay (VPO), Significant Landscape Overlay (SLO), Heritage Overlay (HO) and Erosion Management Overlay (EMO).

Surrounding infrastructure: Street trees are located alongside public and private assets that include footpaths, roads, fences, overhead powerlines and underground services. This pressure is similarly felt on private property for medium and high density developments where there are competing uses and infrastructure to be sited. While there are management and design techniques that can mitigate most of these issues, it is not always easy, particularly with established trees. Established trees have larger roots that can impact footpaths and roads, creating potential hazards that need to be fixed.

Social challenges:

Older people, children, and people with disabilities:

More vulnerable members of the community include older people, young children and people with disabilities and their carers. While trees bring many benefits, they can also create challenges. Maintenance of trees can be challenging for older people or people living with disabilities. Particularly large trees that overhang private property or within the property that can become hazardous through

debris that create trip and slip risks. Aging and/or disability can prevent some residents from being able to manage the debris from trees, requiring the use of private gardening services.

Bayside Council's *Disability Action Plan 2021-2025* states that over 14,000 people living in Bayside have a disability and over 4,000 people need assistance in their day-to-day lives. This assistance is required because of disability, long-term health conditions or old age.

Women's safety: There are a number of elements that contribute to women feeling unsafe, including low visibility and lack of passive surveillance from nearby residents and/or other groups. Within streets, Council plants and maintains trees to ensure there is no foliage to block sight lines. Trees can contribute to this problem if not managed correctly as they have the potential to block visibility from the street if planted too closely together.

What will the Precinct Plans achieve?

A key action from the Bayside *Urban Forest Strategy* is the preparation of Precinct Plans. Each Precinct Plan will be informed by community consultation and will provide set targets to respond to the individual needs, challenges, and aspirations of the locality.

The Precinct Plans will help guide the implementation of the Bayside *Urban Forest Strategy* and direct Council's focus to areas with low vegetation, to protect and enhance neighbourhood character and help achieve the objectives of the Bayside *Urban Forest Strategy*.

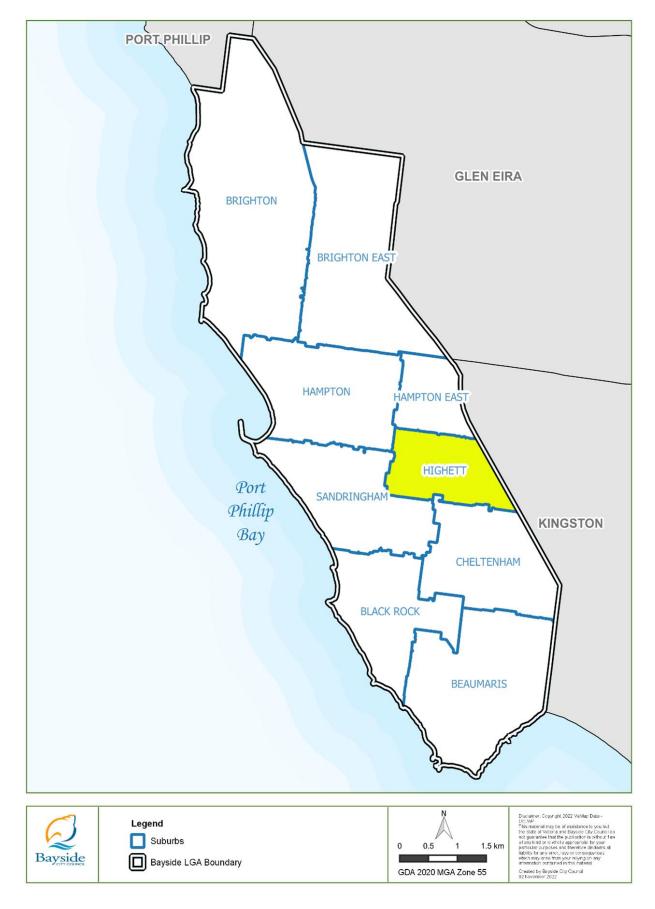

The prime objective of the Precinct Plan is to prioritise areas of greatest need, including areas with the lowest existing percentage canopy tree cover, as well as areas that are strategically located to mitigate urban heat island effects (including within major activity centres that are experiencing increased density and construction activity), areas of declining canopy or aging trees, highly trafficked pedestrian routes and gaps or vacancies in public planting.

Within this document, specific direction is provided on the selection of appropriate trees for the precinct. The Precinct Plans are performance-based in that they establish the desired outcomes for streets but do not prescribe specific species for each location.

High-performance guidelines have been developed to support the Precinct Plans with case studies and detailed guidance on how to achieve enhanced outcomes in parks, streets and nature strips. Parks and significant boulevard trees will be planted using existing master plans and site-specific plans to respond to the individual needs, challenges, and aspirations of the locality. This document focuses on the suburb of Highett.

Map 1: Highett Location within Bayside

Suburb Profile – Highett

Information in this Suburb Profile was accessed from Profile.id which utilises 2021 census data from the Australian Bureau of Statistics and population, household and age structure forecasts.

Population and households:

Highett is a changing suburb, both physically and demographically. Highett is currently experiencing population growth, having increased by 932 people, from 7,020 in 2016 to 7,952 in 2021 and is forecasted to grow to 10,894 (increasing by 33.2%) by 2041. A major factor contributing to Highett's population growth is the large-scale development of the former CSIRO site.

With regard to household size, in 2021 the most dominant household type in Highett was couple families with dependents, which accounted for 36.6% of households. Looking to the future, the household size is forecasted to decrease by 2041. Lone person households is anticipated to become the most dominant household type (increasing from 26.3% in 2021 to 32.5% in 2041), followed by couple families with dependents (27.9% in 2041).

Age structure:

Approximately 30.1% of Highett residents will be above 60 years of age by 2041, a significant increasing from 18.2% (2021). It is expected that older populations will have greater difficulty maintaining gardens and are susceptible to environmental challenges, such as heatwaves and increasing temperatures.

Senior residents who decide to remain in their family home after their children move out become what is known as 'empty nesters'. Many low-density residential dwellings in Highett typically have moderate sized gardens with which empty nesters may have difficulty maintaining and therefore may require assistance now and in the future.

Residential developments:

Residential development forecasts assume the number of dwellings in Highett will increase by an average of 83.9 dwellings per annum to 5,038 by 2041. Approximately 1,022 of these new dwellings will be developed on the former CSIRO site, with the majority being apartments and townhouses.

The forecasted increase in dwellings will also come in the form of low-rise apartment buildings and subdivision of existing lots into units across the suburb. An increase in units and apartments in Highett will increase the area's housing diversity, provide ageing residents with the opportunity to downsize to a smaller home, while staying in their local community. Smaller homes for senior residents provide a number of benefits, including minimising garden maintenance.

However, increases in residential development will reduce the available permeable surfaces to plant trees, which in turn will negatively impact their ability to grow to maturity and provide large canopies. In addition, the facilitation of new residential development will likely see the loss of existing trees and vegetation – a problem that will continue to occur if appropriate processes and planning tools are not put in place.

Climate change:

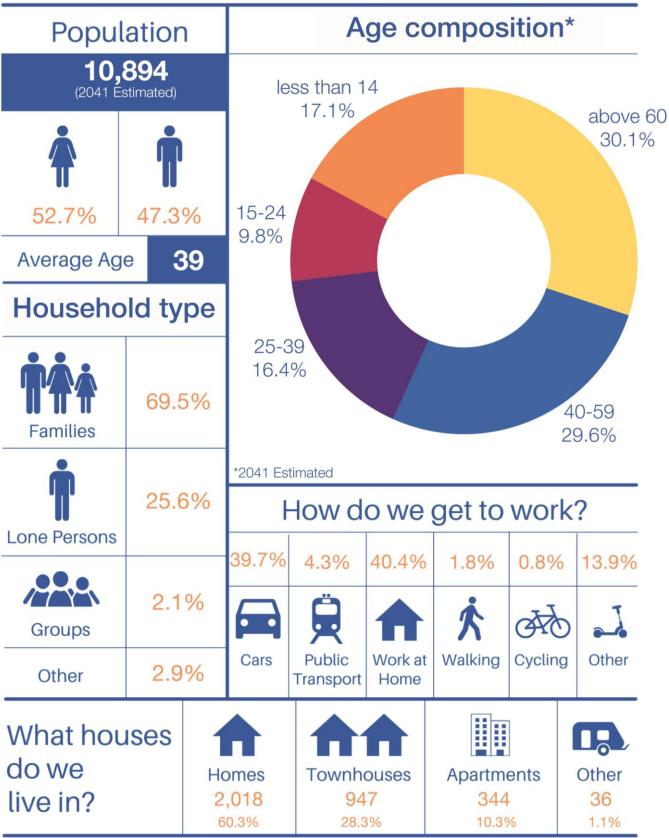

The effects of climate change are anticipated to significantly impact tree canopy and vegetation. Due to climate change, there will be an increase in severe weather events including more intense rainfall over summer, leading to more frequent and severe flooding events. Trees can play an important role in mitigating the impacts of a flooding event. The soil under trees and vegetation absorbs water as opposed to urban impervious surfaces where the water just runs (such as pavement and roofs). The leafy canopy of trees also spreads out the rainfall and slows it down. This gives more time for the soil beneath to absorb the rainfall, resulting in less and slower runoff. As a result, the risk of flooding is

reduced. When flooding does still occur, the volume and speed of the flood will be reduced which will also reduce the need for larger stormwater gutters and pipes.

Mode of transport:

In 2021, 39.7% of Highett residents travelled to work by car compared to 49.7% in Greater Melbourne. Multiple modes of public transport are available, with trains accessible at Highett Station in the Highett Neighbourhood Activity Centre as well as bus routes servicing the suburb.

Note: Highett suburb population and age data is a 2023 estimation for 2041, which was retrieved from the Australian Bureau of Statistics. All other data shown was retrieved from profile.id (2021).

Aerial of Highett

The Vision for Highett's Urban Forest:

Highett will see a sharp increase in tree and understorey plantings, highlighted by a new 1,000 square-metre public open space in the heart of the Neighbourhood Activity Centre. Tree canopies will be expansive, providing local streets with a vibrant new feel.

Planning controls applying to Highett

Residential and Commercial Zones

The majority of Highett's residential land is zoned as Neighbourhood Residential Zone (NRZ) that is applied to areas where there will be minimal residential growth. The NRZ has a maximum building height of two-storeys. Residential growth in these areas of Highett takes the form of detached dwellings, dual occupancy and small multi-dwelling developments.

Residential land within the Highett Large Neighbourhood Activity Centre is zoned General Residential Zone (GRZ) which is applied to areas where there will be moderate residential growth. The GRZ has a maximum building height limit of three storeys. This allows for moderate density development including dual occupancy, unit developments and low-rise apartment buildings.

The former CSIRO site on Graham Road is zoned Residential Growth Zone (RGZ) which is applied to areas where there will be higher density population growth. A development plan has been approved for the site permitting apartment buildings up to six stories and townhouses.

In addition, there is commercial zoned land located within the Highett Large Neighbourhood Activity Centre, various Small Neighbourhood Activity Centres within the suburb, and the Bayside Business District (BBD), which accommodates a small portion of the Highett suburb boundary (north of Bay Road). Commercial and industrial areas generally have lower canopy coverage, which will be targeted and explored further within this Precinct Plan.

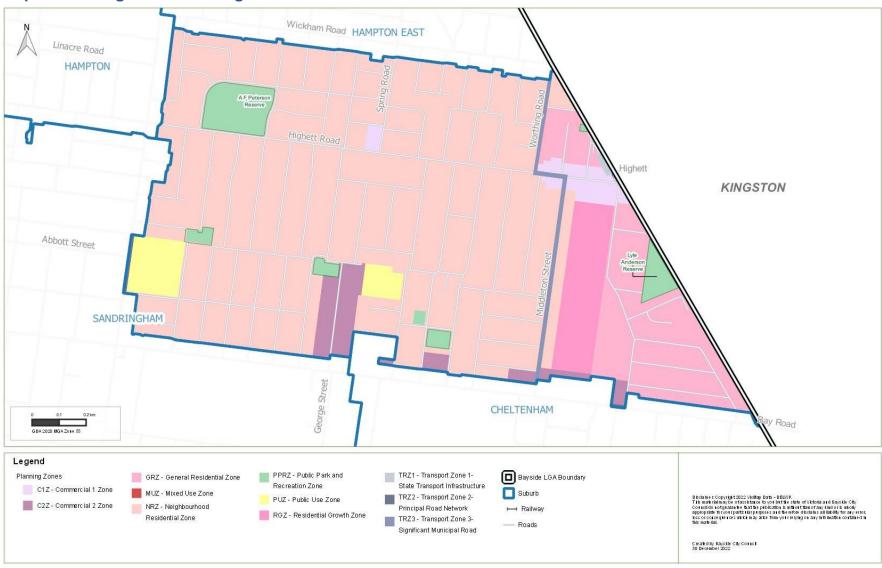

Vegetation Protection controls and overlays

There is currently no vegetation protection overlay applied across the suburb of Highett, nor are there any significant landscape overlays applied to significant areas.

Neighbourhood Amenity Local Law 2021

Local Laws are laws utilised by Council to respond to issues and community needs within a local context. The *Neighbourhood Amenity Local Law* 2021 applies to the Bayside municipality, including trees on private land. The law determines that any tree on private land is protected if the "single or combined tree trunk circumference is 155 centimetres or more at one metre above ground level." If a tree is protected it means that a permit must be acquired from council in order to remove or prune it. The same permit requirements apply to any tree on Council's Significant Tree Register.

Map 2: Planning Controls in Highett

Highett Neighbourhood Character

Highett is a diverse suburb that is currently undergoing increased housing growth, and it is important that new development respects, supports and enhances the cherished characteristics of their surrounding neighbourhood. Clause 15.01-5L 'Bayside preferred neighbourhood character' in the Bayside Planning Scheme provides general objectives and policy guidelines for neighbourhood character precincts that have been set across the municipality.

In Highett, the majority of single and double storey dwellings are of post war style and often double or triple fronted and comprising cream and/or red brick, weatherboard or fibro materials. There are some pockets of more recent two storey development, some of it reproduction style. Front setbacks vary across the area from 6 to 8m and dwellings are usually setback from both boundaries with garages sometimes built to the boundary. Gardens are predominantly low lying, with exotic shrubs and lawn, with occasional large trees providing a backdrop of vegetation. Front fences are mixed with some streets where fences are predominantly low or open style, and others where high fences are more common. Street tree planting is mixed and sporadic.

There are two G3 neighbourhood character precincts that were formerly zoned for industrial/commercial purposes (Map 3). While the western G3 area has remained industrial/commercial, the eastern area has seen development in the form of contemporary two storey, timber clad dwellings.

Examples of neighbourhood character across Highett:

Map 3: Highett Neighbourhood Character Precincts

The Urban Forest of Highett

In Highett, there is approximately 13.9% tree canopy cover and 16.6% understorey cover (2019), which is the lowest canopy cover in comparison to all other suburbs within Bayside. The sparsity in urban forest can be seen amongst streets and front setbacks of new residential development. Street trees are sometimes large but intermittent, and of mixed species. Private gardens consist mainly of understory planting with occasional large trees from mixed species.

Historic planting

The suburb is named after William Highett who was a parliamentarian and local land owner in the 1850s. At this time the area was mainly used for market gardens. In 193,9 a factory was constructed in Highett to build aircraft wings and fuselages to support Australia in the second world war. The factory was active until the end of WWII in 1945 when it closed down and tradesman were transferred to the main factory in Fisherman's Bend. Highett didn't see a substantial level of residential growth until the 1950's when industry was attracted to the area, including the opening of the CSIRO research facility. The 1950's also saw the opening of the suburb's first primary and secondary school.

By 1999, Highett had relatively limited canopy cover in both the private and public realm, giving streetscapes an open feel. Street tree planting was categorised by small scale species, with the exception of Frances Street which had a streetscape dominated by eucalypts, forming an integrated relationship with the private garden vegetation character. The condition of street trees and gardens across the suburb however tended to be poor.²

While the percentage of canopy cover during early residential development is unknown, it is evident there has been a decline in canopy cover, with an estimated 1.4% decrease occurring between 2014 and 2019.

Contemporary issues impacting Highett's urban forest

There are a number of contemporary issues impacting the urban forest of Highett and providing cause to the decrease in canopy cover. Issues associated with climate change, and its flow on effects, such as the urban heat island effect and erratic weather events, are impacting and damaging the health and viability of tree and ground cover vegetation. Increasing tree and vegetation cover will help alleviate rising temperatures and dramatic changes in climatic conditions by providing shade and cooling effects.

For new developments on private and public land, Council considers all possible design solutions and ensures the application has met all relevant criteria. However, even with these measures in place, the removal of tree and understorey vegetation is an issue facing Highett and is likely consequential to the increase in medium density residential development and the limitations on permeable surfaces appropriate for planting.

The removal of established gardens, large trees and understorey plantings is contributing to a loss of the distinct vegetation character and impacting the biodiversity. Other issues impacting the urban forest include:

- Trees nearing the end of their useful lifespan can also create safety issues particularly for more vulnerable residents. As a tree becomes older it loses its strength as is more prone to falling or losing limbs. Council monitors the health of its trees to ensure any hazardous trees are removed.
- The State Government has proposed the removal of the level railway crossings at Highett Road. The construction of this new infrastructure will likely result in the need to remove existing trees and vegetation. Council will need to advocate to the State Government to replace any loss in vegetation, and possibly gain more, by replanting on the site once the construction is completed.

² Bayside City Council, 'Vegetation Character Assessment – City of Bayside' by John Patrick Landscape Architects Pty Ltd, 1999.

- Trees nearing the end of their useful lifespan can also create safety issues particularly for more vulnerable residents. As a tree becomes older it loses its strength and is more prone to falling or losing limbs. Council monitors the health of its trees to ensure any hazardous trees are removed.
- Vandalism of public and private trees is another issue contributing to tree canopy loss across Bayside. Illegal removal, lopping or poisoning of trees occurs throughout Bayside by members of the public for personal gain. A hotspot of this activity is along Beach Road where canopy trees are vandalised to gain better views of Port Phillip Bay. Another common example is the vandalism of trees due to the build-up of leaf debris upon or near private property. Unpermitted removal, destruction, pruning and interference with trees and vegetation is illegal in Bayside. In an effort to deter vandals, Council has adopted a strong stance on vandalism and has installed signs and advertised on social media platforms an offering of rewards for information when an act of vandalism has occurred.

Tree canopy cover across Highett and various land uses

As indicated previously in this document, Highett has the lowest canopy cover in comparison to all other suburbs within Bayside. Of the 13.9% of tree canopy cover within Highett:

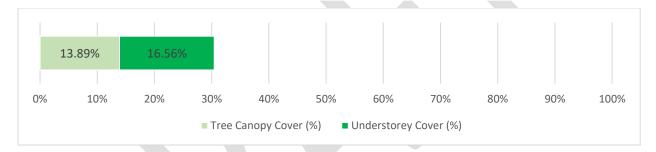

- 68.9% of Highett's tree canopy coverage is located on residential/mixed use land;
- 22.3% is on streets:
- 6.2% is on open spaces/reserves; and
- 2.6% is on public use areas.

In 2022, there were 3,366 trees managed and maintained by Council throughout Highett, with 2,791 street trees, 572 park trees and 3 other location specific trees. Monitoring the age, health and useful life expectancy of these trees is important to ensuring that Council understands the local conditions, maintains tree and understorey plant populations, and effectively plans for future planting programs and strategies across Highett.

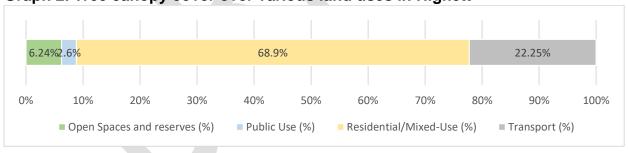

Map 4 identifies locations of tree canopy cover across Highett.

Graph 1. Tree canopy cover in Highett

In Highett, there is approximately 13.9% tree canopy cover and 16.6% understorey cover. The suburb of Highett will be a major contributor towards achieving Council's goal of 30% tree canopy cover by 2040 and the enhancement of understorey cover within the public and private realm.

Map 4: Tree canopy cover over Highett

Council-managed Tree Population

Useful life expectancy (ULE)

Estimating the useful life expectancy of the council-managed tree population is regularly undertaken and can inform the future management options for trees that have limited useful life left. The assessment of a tree's useful life expectancy provides an indication of health and tree appropriateness and involves an estimate of how long a tree is likely to remain in the landscape based on species, stage of life (cycle), health, amenity, environmental services contribution, conflicts with adjacent infrastructure and risk to the community.³ It is not a measure of the biological life of the tree within the natural range of the species, but more a measure of the health status and the tree's positive contribution to the urban landscape.³

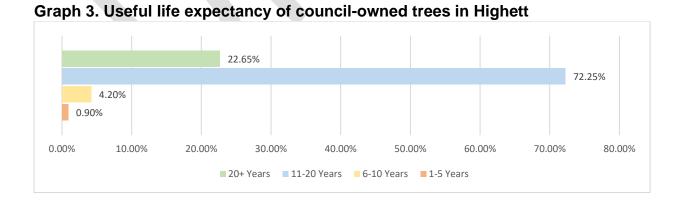

There are approximately 254 (5.1%) council-managed trees that may not survive in Highett after the next 10 years. By 2040, a total of 2,681 (77.4%) council-managed trees will have reached the end of their useful life expectancy and may need to be replaced.

Where trees reaching the end of their useful life expectancy have been assessed and are no longer providing a benefit to the surrounding habitat, removal may be required. Where it has been found that trees reaching the end of their useful life still provide benefit and habitat, it should be retained as habitat tree as per the Tree Risk Assessment Tool (TRAQ). Where replacement of trees is required, new trees should be selected based on the existing surrounding vegetation, landscape character and ability to enhance habitat. Where there is a large concentration of trees required for replacement, this should be undertaken intermittently to enable varying ages and maturity.

Advantage Road Park, Tibrockney Street Park and A F Peterson Reserve are all locations where there is a high concentration of trees that will need to be replaced in the next 10 years.

In Highett, approximately 5.1% of council-managed trees will not survive after the next 10 years. The map shows the location of trees with low ULE and the locations where the concentration of these trees is high.

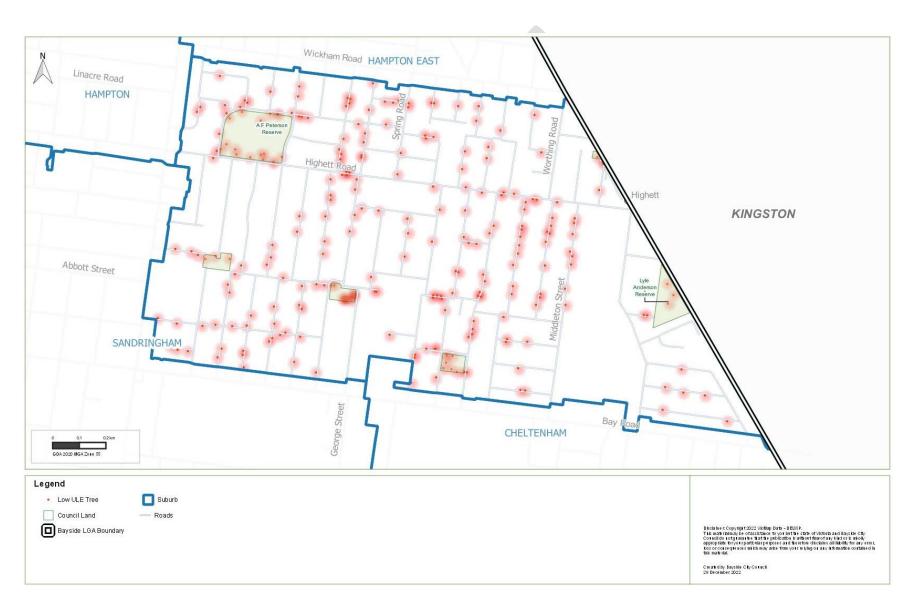

Where it has been found that trees reaching the end of their useful life still provide benefit and habitat, it should be retained as habitat tree as per the Tree Risk Assessment Tool (TRAQ).

https://www.planning.vic.gov.au/__data/assets/pdf_file/0011/105500/SHRP-SH1-15.a.-Tree-Logic-Rpt_Holland-Court,-Flemington.pdf

³ Department of Health and Human Services, 'Arboricultural Assessment Holland Court, Flemington– 3.7 Useful Life Expectancy(ULE)', 2017, Available at

Map 5: Location of trees with low ULE

Tree health and age

Approximately 83.8% of Council-managed street and park trees in Highett are classified as being in good health, while 5.6% were classified as 'excellent'. Trees that are classified as poor, dangerous or dead make up for 0.9% of street and park trees in Highett (Graph 4).

There is a reasonable level of diversity in the age of Highett's trees. As seen in Graph 5, the highest proportions are new and semi-mature, making up 42.9% and 22.6% respectively.

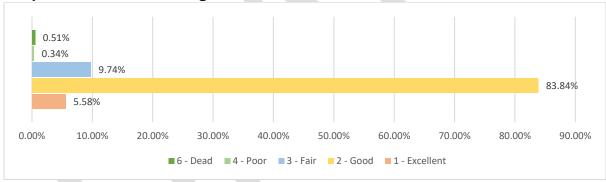

Map 6 provides the location of those tree that are in poor health or dead. Street trees that are dead should be removed but dead trees in parks can provide habitat for fauna. Map 6 shows small concentrations of three dead park trees in both A F Peterson Reserve and Lyle Anderson Reserve, as well as seven dead street trees across the suburb, with two in Delmont Street.

Where trees reaching the end of their useful life expectancy have been assessed and are no longer providing a benefit to the surrounding habitat, removal may be required. Where it has been found that trees reaching the end of their useful life still provide benefit and habitat, it should be retained as habitat tree as per the Tree Risk Assessment Tool (TRAQ).

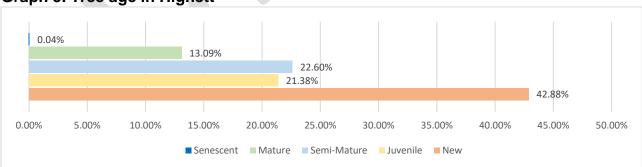

In 2022, 83.8% of the council-managed street and park trees in Highett were classified as being in good health. Trees that are classified as poor, dangerous or dead make up for 0.9%.

Where it has been found that trees reaching the end of their useful life still provide benefit and habitat, it should be retained as habitat tree as per the Tree Risk Assessment Tool (TRAQ).

Graph 4. Tree health in Highett

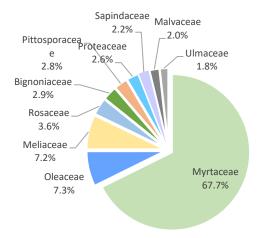

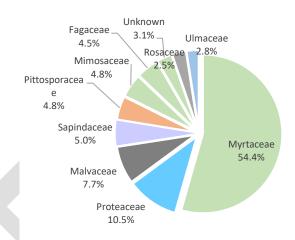

Map 6: Tree health in Highett

Species diversity

A resilient urban forest has a diverse range of species from different families. As seen in graphs 6 and 7 below, Council-managed street and park trees in Highett are predominantly within the *Myrtaceae* family, making up to 67.7% of all street trees and 54.4% of all park trees. This is then followed by the *Proteacaea* family (10.5% of all park trees), and the *Oleaceae* family (7.3% of street trees). Other families make up about 25% of street trees and 35% of park trees.

Graph 6. Diversity of street tree species in Highett

Graph 7. Diversity of park tree species in Highett

The reliance of a small number of species, and a lack of spatial diversity in species distribution, leaves the urban forest vulnerable to threats from pests and disease. Diversification of the family composition of the urban forest was a key challenge that was previously identified in the Bayside Street and Park Tree Guide and reiterated within the Bayside Urban Forest Strategy.

The following families currently form part of the overall tree population in Highett's streets and parks at a significantly lower percentage than the *Myrtaceae* family. The inclusion and increase of these families should be targeted through the actions and implementation of this Precinct Plan, ensuring that different types of trees align with the neighbourhood character of the surrounding locality:

- Oleaceae
- Meliaceae
- Rosaceae
- Bignoniaceae
- Pittosporaceae
- Proteaceae
- Sapindaceae
- Malvaceae
- Ulmaceae
- Mimosaceae
- Fagaceae.

In order to improve species diversity, Council is undertaking investigations through its *Park Improvement and Habitat Linkage Plan* to understand which species (trees and vegetation) would best support specific locations in Bayside and encourage the rebuilding of the ecological foundations in Bayside.

Currently, the Highett street and park tree population is largely dominated by the *Myrtaceae* family (eucalyptus etc.), making up 54.4% of park trees and 67.7% of all street trees.

Understorey planting in Highett

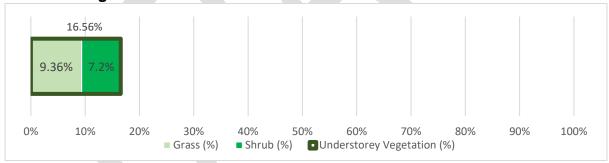

This section of this document investigates the potential habitat and biodiversity corridors in Highett across public and private land to understand where further opportunities exist to increase habitat connectivity and improve biodiversity.

Understorey vegetation includes small trees, shrubs, herbs, grasses, mosses and lichens that occupy the vegetation layers below the canopy of taller trees. Bayside's *Urban Forest Strategy* has three major goals to ensure the increase and improvement of the urban forest and the functions it serves. Two of these goals recognise the importance of understorey plantings. In addition, one of the strategic objectives of the Bayside *Urban Forest Strategy* is to support and enhance our local biodiversity and protect locally endangered and native species. This will be achieved by improving habitat connectivity and the protection and planting of Ecological Vegetation Classes (EVCs) through the implementation of the *Park Improvement and Habitat Linkage Plan* 2022 which identifies suitable locations to prioritise understorey planting.

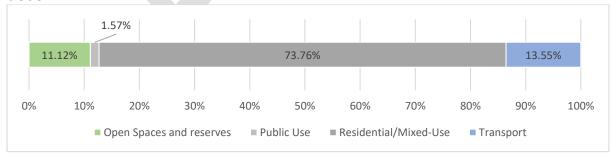

There is currently 16.56% of understorey vegetation coverage in Highett, with a majority of this being located on residential/mixed use land (73.76%), as depicted in Graph 8 and 9 below.

Council's priority will be to increase understorey planting in a range of ways and in varying locations, including streets with less than 20% tree canopy cover, roundabouts without current vegetation (Peterson Street - Tweed Street, Lawson Parade - Clements Street, Lawson Parade - Sydenham Street), core habitat patches/priority habitat improvement areas/priority linkage improvement areas (identified in Maps 10-11) and in gaps around sporting ovals (Ashwood Avenue Park, Highland Avenue Playground, Eddie Reserve, Highett Tennis Club, Train Street Park and Lyle Anderson Reserve). Council will also encourage residents to have biodiverse gardens with indigenous and native plants.

Graph 8. Percentage distribution of understorey vegetation as grass and shrubs in Highett

Graph 9. Percentage distribution of understorey vegetation in different land uses

Map 7. Understorey planting in Highett

Urban Heat Island

Urban heat island effect in Highett

Urban heat island effect is the phenomenon of dense urban areas having significantly warmer air and land surface temperatures than surrounding areas.⁵ It is primarily a result of impervious hard surfaces that generate heat and low vegetation cover that fails to provide adequate shade and natural cooling.

Urban heat data was captured in 2018 and provided in Map 8 below. It is evident from this map that there are various areas of Highett, particularly in the north, east and centre of the suburb, which are undergoing increased temperatures and are subject to urban heat island effects.

Increased greening and enhancement of the urban forest has been identified as one of the most costeffective means of mitigating the potential impacts of climate change and urban heat island effects.
Planting will be prioritised on streets in Highett impacted by urban heat island effects. Some of these
streets include Highett Road, Middleton Street, Spring Road and Worthing Road. In Activity Centres
that are facing high temperatures innovative techniques such as green roofs and walls will be
explored and encouraged to increase vegetation. All streets most severely impacted are displayed on
Map 20 later in this Precinct Plan and listed in the implementation plan.

This Precinct Plan seeks to prioritise planting and innovative techniques such as green roofs and walls in areas that are currently facing higher temperatures due to increases in impervious hard surfaces that generate heat.

Map 8 - Urban Heat - Increased temperatures within Highett

Biodiversity Assessment

To help inform the Bayside *Urban Forest Strategy*, Council undertook a desktop biodiversity assessment across the entire municipality. The purpose of the desktop biodiversity assessment was to assess and identify the existing ecological values present within the municipality and identify key areas where biodiversity could be improved. This section of the Precinct Plan will focus on the findings of this assessment within the suburb of Highett.

Strategic Biodiversity Value Score

The Strategic Biodiversity Value (SBV) is a ranking system developed by the Department of Transport & Planning (DTP) that ranks the biodiversity contribution that a location has to Victoria's overall biodiversity. The SBV is presented as a score ranging between 0 and 1 and is mapped across all areas of Victoria.⁶

56 areas with SBV scores were identified within Bayside, all of which exist on public land and are provided in Map 9. There was only one location within Highett which presented a SBV score. The location is the Avoca Street Retarding Basin, with a score between 0.2 and 0.4.

To ensure SBV scores modelled within these areas do not decrease over time, native restoration and plantings in these areas must continue when required. It is important that these areas remain as much in their current condition as possible to preserve the ecological values present within these areas.

Ecological Vegetation Classes (EVCs)

As a part of this study a review of Ecological Vegetation Classes (EVCs) model was undertaken. A total of 10 EVCs were modelled within the Bayside area and provided in Map 10. However, these have largely been cleared and do not represent what they once were, due to human settlement and the extensive residential development that has occurred, and the associated road, rail and commercial development. While it's not possible to restore our environment to what it was like presettlement, we can improve how we restore native vegetation and ensure what we are planting is complimentary and in replica to what was historically within these EVC areas.

Of the 10 EVCs modelled within Bayside, one has been identified within Highett. This EVC is grassy woodland/damp sands herb-rich woodland mosaic at the Avoca Street Retarding Basin. This identified EVC has informed the species palette in Appendix 3 to this Precinct Plan. The species palette provides guidance on species of trees and vegetation that should be planted in order to enhance the character of the urban forest.

Map 9 - Biodiversity Value Score

Map 10 – Ecological Vegetation Classes

Park Improvement and Habitat Linkage Plan 2022

The Park Improvement and Habitat Linkage Plan 2022 was undertaken by Council as a way to improve species diversity within Bayside and understand what species (trees and vegetation) would best support specific locations in Bayside and encourage the rebuilding of ecological foundations. The objective of the plan is to assist in increasing the diversity of indigenous and native plantings in council-owned open spaces outside the conservation reserve system and strengthen the connections between natural areas.

Two major actions identified in the *Park Improvement and Habitat Linkage Plan* that correspond to the outputs of the Highett Precinct Plan are:

- 1. Streetscapes Wherever possible, increase the extent of indigenous understorey vegetation in verges, nature strips, roundabouts, traffic islands and edges of carparks or other less frequented or unused areas.
- 2. Parklands Expand on areas of existing native vegetation (both patches and individual trees) with dense understorey plantings, or identify locations for additional native plantings, to create structurally diverse 'habitat planting zones.'

Conservation reserves in Highett

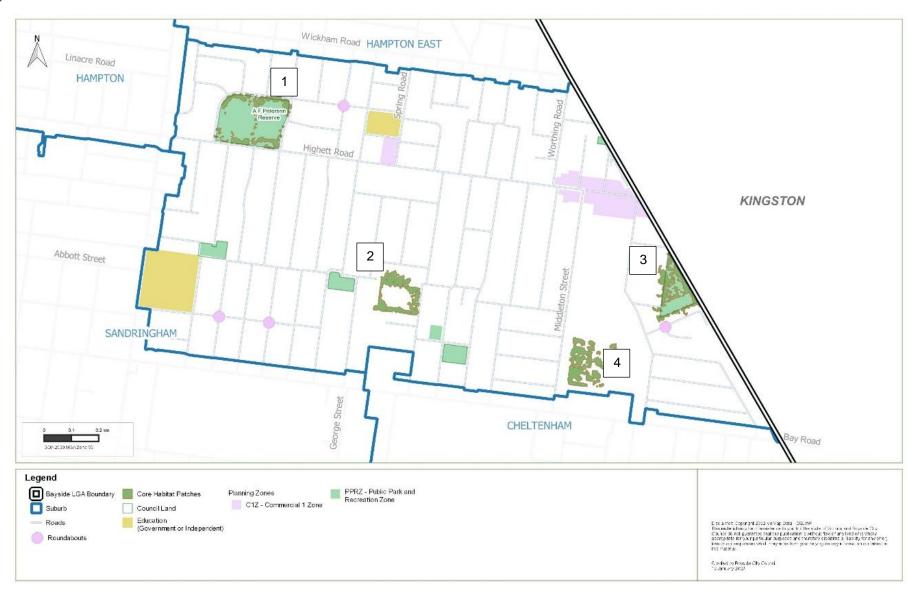

• Highett Grassy Woodland Reserve.

Core Habitat Patches

Four core habitat patches have been identified within Highett as areas where planting should occur to implement new or improve existing links to areas of open space and provide habitat corridors:

- 1. A F Peterson Reserve
- 2. Avoca Street Retarding Basin
- 3. Highett Grassy Woodland Reserve
- 4. Lyle Anderson Reserve.

Map 11 - Core Habitat Patches

Priority Habitat Improvement Areas

Priority habitat locations are primarily associated with parks or reserves that currently support high-quality habitat values (such as bushland or foreshore reserves) or have the potential to provide core habitat with further investment through on-ground plantings and complimentary habitat structures.⁷

Priority Habitat Improvement Areas identified in Highett are:

• A F Peterson Reserve.

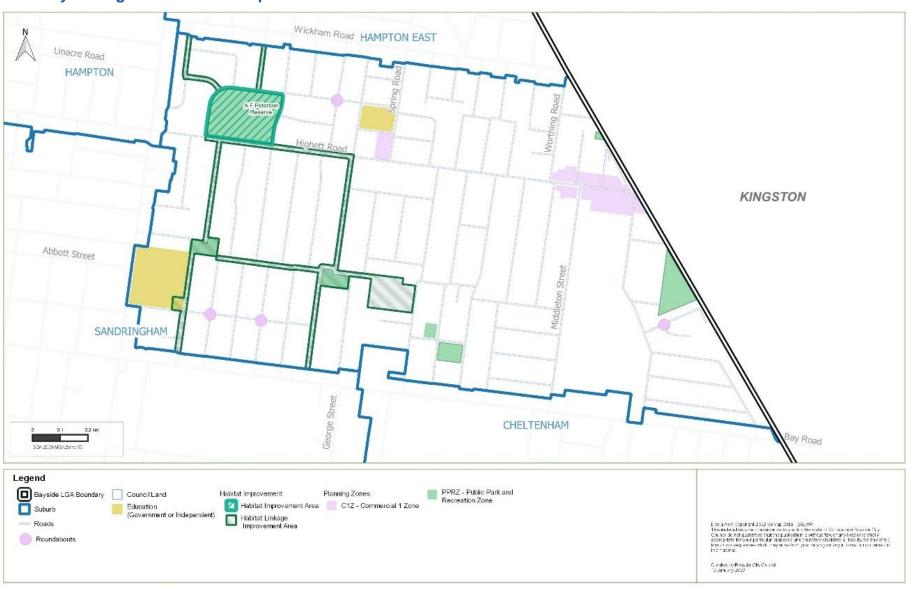

Priority Linkage Improvement Areas

Linkage Improvement Areas are primarily associated with public road reserves with an objective to increase the functional diversity of vegetation within these areas to improve connectivity for a broader range of species. Locations of priority linkages identified across the municipality have been restricted to public land, except for limited instances within privately owned golf courses.

- A F Peterson Reserve to Hampton East via Frederico Street/June Street and Danson Street.
- A F Peterson Reserve to Sandringham via Ashwood Avenue, Ashwood Avenue Park and Lansell Avenue
- A F Peterson Reserve to Sandringham via Highett Road, Miller Street, Advantage Road Park and Highland Avenue.
- Ashwood Avenue Park to Avoca Street Retarding Basin via Marchant Street and Advantage Road Park.

Park Improvement and Habitat Linkage Plan, Bayside City Council (2022)

Map 12: Priority Linkages and Habitat Improvement Areas

Trees on Private Land

While we encourage and support the increase of tree canopy cover on private land, it is recognised that the uptake of tree planting on private land can only be enforced through better planning mechanisms, education, advocacy and commitment from the community.

The objectives of the Bayside *Urban Forest Strategy* is to prioritise and strengthen the support for retaining existing trees on public and private land and to strengthen Council's ability to retain and monitor trees on both public and private land.

Regulations involving trees on private land

Under the *Neighbourhood Amenity Local Law 2021*, a permit is required for the removal of a tree that is on the Significant Tree Register or a canopy tree that has a single or combined trunk greater than 155 centimetres measured at 1 metre above ground level. There are currently nine trees in Highett that are on the Significant Tree Register.

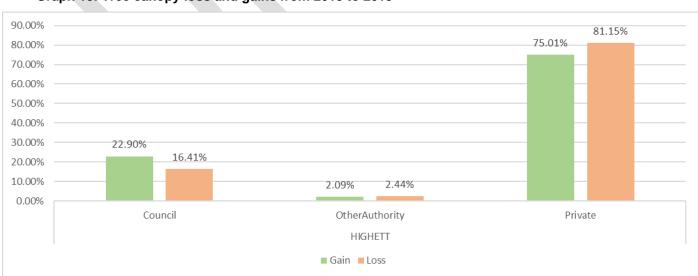

There are several mechanisms currently in place within the Bayside Planning Scheme that require a planning permit to be granted for tree removal. These mechanisms include but are not limited to the Vegetation Protection Overlay (VPO), Significant Landscape Overlay (SLO) and the Heritage Overlay (HO). The HO is however the only overlay that applies to selective private properties in Highett.

It is difficult to approximate the number of trees removed from private land each year under a planning permit as this is not separately recorded (and one application can be for multiple tree removals), let alone the extent of tree removal that is legal or illegal.

As indicated in Graph 10, while private land contributes to 75% of tree canopy gains in Highett, it also contributes to 81.2% of tree canopy losses. Conversely, council-owned land contributed 22.9% to tree canopy gain versus 16.4% of tree canopy loss. Losses and gains were calculated by comparing 2015 and 2019 canopy cover data.

Tree canopy loss and gain in Highett on private land

Map 13 shows the location of where this tree canopy loss and gains has occurred in Highett from 2015 to 2019. The source aerial photography datasets were obtained from the State Government's Coordinated Imagery Program (CIP). The datasets from 2015 and 2019 were further compared by Council's GIS team to identify changed areas of vegetation.

Graph 10: Tree canopy loss and gains from 2015 to 2019

Encouragement of trees on private land

As mentioned in the Bayside *Urban Forest Strategy*, community engagement will be essential in growing the urban forest on private land and Council will continue to be proactive in communicating the benefits of trees and vegetation on private land.

Council will also investigate opportunities to provide free tree and vegetation giveaways to residents. This will provide Council with a pathway to influence the tree and vegetation cover that exists on private land and help residents maintain the health of their trees and gardens. Bayside already has a strong network of 'Friends of' groups and community volunteers who carry out tree and vegetation plantings and would be great allies in this work.

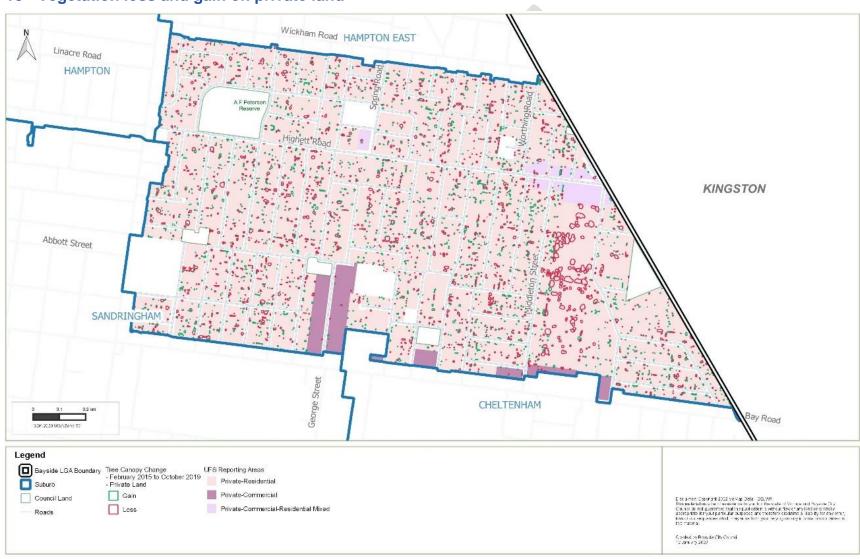

Council will encourage landowner participation in greening, particularly for areas identified as having less canopy cover. This is being undertaken through communications and engagement actions that has a focus on education, awareness on the benefits of vegetation, and participation in increased tree planting through various education programs.

There has been a greater interest from the younger population of Bayside to participate in increasing vegetation cover. Council will continue to run educational programs within schools and work alongside the community to reach the *Urban Forest Strategy* target of 30% canopy cover across Bayside by 2040

As part of the Bayside *Urban Forest Strategy* Implementation Plan, Council is exploring opportunities to include further policies and planning mechanisms within the Bayside Planning Scheme with an aim to maintain and increase tree canopy and vegetation on private land.

Map 13 - Vegetation loss and gain on private land

Highett in Images

The following images show examples of low, medium, and high tree canopy coverage in Highett.

Image 6. Holyrood Street, an example of a road with low tree canopy coverage.

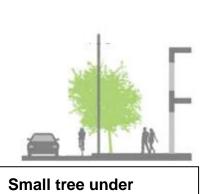

Image 8. Princess Avenue, an example of a road with high tree canopy coverage.

Image 7. Panorama Avenue, an example of a road with medium tree canopy coverage.

Key Constraints – Infrastructure

Finding locations for street and park tree planting can be challenging as it is important to ensure trees do not compromise the existing above and below infrastructure, as well as the existing uses and accessibility of the space.

Tree trimmed under

Certain pieces of infrastructure introduce constraints that impact the ability to plant trees. Street and park tree selection for trees growing under powerlines need to consider a particular species' tolerance for pruning. For example, a tree that has a natural branching habit and a good wound response to mechanical damage would be considered an appropriate tree species for growing under powerlines.

In streets that have small or narrow nature strips, a smaller tree species will be considered for the powerline side of the street. In those circumstances, the trees on both sides of the street should have similar foliage and form to provide a consistent vegetation character for the street.

As a phase 1 action of this Precinct Plan, Council will facilitate negotiations between residents and relevant authorities to support the undergrounding of powerlines (and other services) if there is sufficient interest in a street. Council will also advocate to VicRoads and other authorities for undergrounding the powerlines and plant vegetation on the Principal Transport Network. Other infrastructure that must be considered when undertaking tree and vegetation planting includes:

- Footpaths
- Kerb and channel
- Roadways
- Playgrounds
- Pathways
- Private infrastructure
- Public infrastructure.

When selecting tree species for planting, Council officers consider which species will be the least destructive to underground infrastructure. Potential opportunities to install root barrier systems and other protection mechanisms are also investigated at the locations of key underground infrastructure. This will ensure that Council can increase vegetation cover whilst protecting existing infrastructure and reducing demand for maintenance.

It is also important to note that infrastructure can also be constrained due to weather events. The Climate Emergency Action Plan 2020 requires that new infrastructure be designed to higher environmental standards and is located with consideration to future flood and storm surge risk. Existing infrastructure has to be retrofitted to reduce environmental impact and to improve resilience. It is critical to consider how each piece of new infrastructure can contribute to a more resilient built environment. Adapting to climate change requires taking actions to lessen its adverse consequences and increase capacity to withstand the stresses and shocks associated with natural hazards and extreme weather events. Investing in climate change adaption helps to embed economic, social, and environmental resilience to protect the most vulnerable to the consequences of climate change.

Map 14 – Infrastructure servicing across Highett

Key Opportunities in Highett

Greening Highett

Increasing tree canopy cover to reach 30% and vegetation cover to reach 30% across Highett by 2040.

Biodiverse suburb

Create a diverse and healthy urban forest that reinforces greater outcomes for biodiversity.

Improve monitoring and maintain

Improve the ability to monitor and track along with maintaining our existing canopy cover and avoid further decline.

Encourage residents and private owners

Learn together, educate each other, encourage and celebrate greater care and protection.

Council-owned open spaces

Highett has approximately 7.6 hectares of open space that includes parks and reserves.

Opportunities exist to increase planting at those open spaces that currently have vacant sites, core habitat patches or have been identified as habitat linkage and improvement areas.

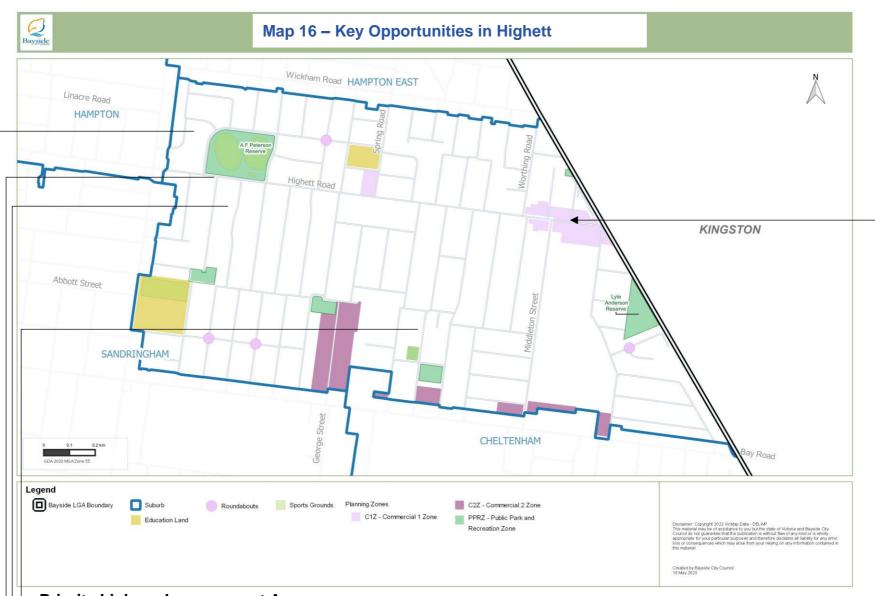

Former CSIRO Site Development

As part of the development of the former CSIRO site, Council is receiving 4 hectares of land to be utilised as open space. Of this space, 3 hectares will continue to be designated as the Highett Grassy Woodlands Conservation Reserve at the southern end of the site. A separate hectare of open space will be developed at the northern end of the site, and in totality provides a significant opportunity to preserve and enhance tree and understorey vegetation.

Council-owned projects

There is a significant opportunity to increase vegetation cover in Highett through councilowned projects like the renewal or development of community buildings and sporting club facilities. Each Council project has site-specific issues and opportunities that need to be considered as part of the project scope. Examples of this include having a buffer around Council buildings and sporting ovals to ensure new plantings do not hinder future projects.

When planting near sporting ovals, maintenance of future trees must be considered to ensure sporting events are not impacted.

Priority Linkage Improvement Areas

- A F Peterson Reserve to Hampton East via Frederico Street/June Street and Danson Street.
- A F Peterson Reserve to Sandringham via Ashwood Avenue, Ashwood Avenue Park and Lansell Avenue
- A F Peterson Reserve to Sandringham via Highett Road, Miller Street, Advantage Road Park and Highland Avenue.
- Ashwood Avenue Park to Avoca Street Retarding Basin via Marchant Street and Advantage Road Park.

Commercial areas

There are two activity centres within Highett that accommodate commercial uses and are zoned C1Z:

- Highett Activity Centre (Large Neighbourhood Activity Centre)
- Little Highett Village (Small Neighbourhood Activity Centre)

The character of these commercial centres can be improved by increasing tree vegetation cover.

Educational land

Council will work with other State Government departments and with private owners to increase vegetation cover on educational land. The schools within Highett are St Agnes' Primary School and Sandringham College.

Understorey planting

Council's priority will be to increase understorey planting in a range of ways and in varying locations, including streets with less than 20% tree canopy cover, roundabouts without current vegetation, core habitat patches/priority habitat improvement areas/priority linkage improvement areas and in gaps around sporting ovals. Council will also encourage residents to have biodiverse gardens with indigenous and native plants.

Roundabouts

Roundabouts will be considered as opportunities to plant canopy trees and understorey planting when appropriate. New plantings must not affect sight lines, safety or accessibility for larger vehicles. To ensure future planting is appropriate a Road Safety Audit will be completed before and after installation.

Nature strips

In terms of tree planting, the *Street* and *Park Tree Management Policy* states that:

'Council aims to have 100% of suitable sites within Bayside planted with a tree to contribute to the municipality's leafy character. Most property frontages in Bayside can accommodate at least one tree within the nature strip.'

Prioritising Trees and Vegetation in streets

Streets make up approximately 18.5% of the total area of Highett. When prioritising where to plant, it is important to focus resources in the locations that need it most. This includes consideration of where we have opportunities to plant understorey, improvement of habitat, where the highest density of people reside, and where very low canopy cover exists.

Tree replacements are only identified for streets where the useful life expectancy of multiple trees is rated at less than 10 years.

Planting priorities

The Implementation Plan later in this document identifies phase 1 actions that are to be delivered within the next 5 years. These actions along with the Park Improvements and *Habitat Linkages Plan 2022* will identify priority areas and inform the planting program.

As a response to the Bayside *Urban Forest Strategy*, Council is committed to increasing tree planting every year. Maps 17 to 20 identify priority locations to be targeted in Council's annual tree planting program.

The Annual Tree Planting Program provides a great opportunity to increase species diversity, habitat and local character. A general rule of thumb that should be applied is the 10:20:30 rule, where the urban tree population includes no more than 10% of any one species, 20% of any one genus, or 30% of any family.

Implementation Plan

The following set of actions specifically identifies outcomes for trees and vegetation planting. They provide the framework for change within Highett with outcomes informed by all the other factors outlined in previous sections.

Phase	Objective	Action	Responsibility	Timeframe	Resources required	Measure
Create a	diverse and healthy urb	an forest that reinforces greater outcomes for biodiv	versity.			
Phase 1	Prioritise and increase planting on identified habitat and biodiversity corridors across public land to enhance habitat linkages.	Investigate opportunities to provide increased understorey planting in areas identified as part of Council's Park Improvement and Habitat Linkage Plan (Map 10 - 11), including: Priority Habitat Improvement Areas: • A F Peterson Reserve. Priority Linkage Improvement Areas: • A F Peterson Reserve to Hampton East via Frederico Street/June Street and Danson Street. • A F Peterson Reserve to Sandringham via Ashwood Avenue, Ashwood Avenue Park and Lansell Avenue • A F Peterson Reserve to Sandringham via Highett Road, Miller Street, Advantage Road Park and Highland Avenue. • Ashwood Avenue Park to Avoca Street Retarding Basin via Marchant Street and Advantage Road Park. Core habitat patches: • A F Peterson Reserve • Avoca Street Retarding Basin • Highett Grassy Woodland Reserve • Lyle Anderson Reserve.	Open Space	Year 1 to 2	Budget allocated for 2022/23 and 2023/24 financial years.	Park Improvement Habitat Linkage Plan and the Urban Forest Strategy Annual Reporting Program.
Phase 1	Enhance biodiversity outcomes on private land.	Encourage private landowners to plant vegetation on nature strips within their street and provide support and tools to assist. To ensure new plants enhance habitat and biodiversity, Council officers should recommend appropriate plants listed in Appendix 3 Species Palette of this document.	Urban Strategy, Communication and Engagement	Ongoing	Budget may be required to create and implement specific engagement plans.	Utilise engagement evaluation matrix to measure success. Increased number of community members involved in activities. Increased demand from residents for vegetation outside their house.
Phase 1 & 2	Create new open space, pocket parks, micro-forests in the suburb seeking new biodiversity or habitat corridors.	Investigate opportunities to seek funds to support the acquisition of land for new open spaces to connect core habitat patches.	Open Space	Ongoing	Resources required for advocacy	Number of grants / opportunities applied for.
Phase 1	Ensure humans and wildlife can simultaneously and safely access densely vegetated areas, streets and reserves.	Support the undergrounding of powerlines where it is at the request of the community and at their full cost. Facilitate the negotiations between the residents and relevant authorities to support the undergrounding of powerlines (and other services) if there is sufficient interest in a street.	Asset Protection, Urban Strategy	Ongoing	No budget required.	Number of streets where undergrounding of powerlines has been implemented.
Enhance	landscape outcomes ar	nd increase tree and vegetation cover to reach 30% a	across Highett by prioritising a	areas in greate	est need	
Phase 1	Increase tree and understorey cover at areas with greatest need to	Investigate opportunities to increase canopy tree and understorey planting at the following streets which have been identified as having low canopy cover (less than 20%):	Open Space	Year 1 to 5	Budget and resources will be required to increase the number of trees and understorey plants to be planted.	Number of plants planted

Phase	Objective	Action	Responsibility	Timeframe	Resources required	Measure
	enhance landscape outcomes, provide for heating and cooling benefits and combat climate change.	 Worthing Road Highett Road (between Worthing Road/Middleton Street only) Middleton Street In addition, investigate opportunities to increase tree and understorey cover at the following streets which have been identified as hot spots due to potential impacts from Urban Heat Island effects: June Street, Morley Crescent, Highett Road Jillian Avenue, Regworth Court, Bluff Road Lansell Avenue, Lawson Parade, Clements Street Frances Street, Marchant Street, Highland Avenue Advantage Road, Peterson Street, Danson Street Telford Street, Fuge Street, Molong Avenue Tweed Street, Clyde Street, Hazel Avenue Locinda Street, Spring Road, Maralber Road Panorama Avenue, Seaton Road, Hillcrest Avenue Maroona Road, Muir Street, Holyrood Street Herbert Street, Baldwin Street, Harding Street Allen Street, Monamie Avenue, Wolseley Street Livingston Street, Worthing Road, Train Street Graham Road, Thistle Grove, Jackson Road Princess, Royalty Avenue, Middleton Street Donald Street, James Avenue, Albert Street Beaumaris Parade, Rupert Street, Sterling Avenue Eddie Street, Tibrockney Street, Avoca Street Rose Street, Maxflo Court, George Street, Miller Street. 				Urban Forest Strategy Annual Reporting Program.
Phase 1	Planting canopy trees and understorey vegetation on roundabouts that currently do not have vegetation to enhance landscape outcomes.	Investigate opportunities to provide understorey and/or canopy tree planting at the following roundabouts (as per Map 16):	Open Space, Integrated Transport	Year 1 to 5	Open Space and the Integrated transport team to guide and undertake road safety audit before and after planting. Budget and resources will be required to increase the number of trees and understorey plants to be planted.	Number of plants planted Urban Forest Strategy Annual Reporting Program.
Phase 2	Increase utilisation of green walls and green roofs in Activity Centre area.	Encourage innovative greening in Highett Neighbourhood Activity Centre by educating community by promoting and piloting different greening initiatives. Investigate opportunities to introduce planning mechanisms to increase green roofs and walls within Activity Centres.	Development Services, Economic Development, Strategic Planning	Year 5 to 10	Economic Development team may require budget to run pilot programs	Number of plants planted Urban Forest Strategy Annual Reporting Program
Phase 1 and 2	Reframe Council's approach to major council-owned projects, capital infrastructure renewal projects as opportunity to increase urban forestry outcomes.	Explore opportunities within road reconstruction projects to provide new tree plots as boulevard planting or in between car parking bays to enhance tree and vegetation cover upon local streets.	Project Services	Ongoing	Budget will be considered as part of the project scope.	Number of plants planted. Urban Forest Strategy Annual Reporting Program.
Phase 1	Increase tree canopy cover by prioritising plantation in vacant tree sites.	As part of the planting program, continue to identify the current vacant sites and prioritize planting at these sites.	Open Space	Ongoing	Budget and resources will be required to increase the number of trees and understorey plants to be planted.	Number of plants planted Urban Forest Strategy Annual Reporting Program

Phase	Objective	Action	Responsibility	Timeframe	Resources required	Measure
Learn tog	gether, educate each oth	ner, encourage and celebrate greater care and protec	ction of the Bayside Urban For	rest		
Phase 1	Increase planting on VicRoads roads that have less than 20% of tree canopy cover.	Advocate to VicRoads and other authorities for increased planting on Bay Road and Bluff Road.	Open Space, Urban Strategy	Ongoing	No budget required.	A commitment made to plant trees on the streets maintained by VicRoads
Phase 1	Increase awareness amongst the community around the importance of vegetation through various programs and communication material.	Continue to run student and community educational programs to increase awareness around vegetation planting and protection.	Urban Strategy, Communication and Engagement	Ongoing	Budget may be required to create and implement educational programs.	Number of educational programs undertaken every year
Phase 1 and 2	Ensure humans and wildlife can simultaneously and safely access densely vegetated areas, streets and reserves.	Advocate to VicRoads and other authorities for the undergrounding of powerlines.	Urban Strategy	Ongoing	No budget required.	Funding received and/or partnerships created.
Maintain	our existing canopy cove	er across Highett and avoid any further decline where p	possible			
Phase 2	Ensure our urban forest is healthy and resilient.	Where trees reaching the end of their useful life expectancy have been assessed and are no longer providing a benefit to the surrounding habitat, removal may be required. Replacement trees should be selected based on the surrounding environment, neighbourhood character (where relevant) and above and below ground infrastructure. It is noted that there are various trees potentially reaching the end of their useful life expectancy, at the following locations (Map 5): • Highland Avenue Playground • AF Peterson Reserve • Eddie Reserve. Where it has been found that trees reaching the end of their useful life still provide benefit and habitat, it should be retained as a habitat tree as per the Tree Risk Assessment Tool (TRAQ).	Open Space	Year 5 to 10	Budget and resources will be required to increase the number of trees and understorey plants to be planted.	Number of replacement plants planted, and number of those trees retained for habitat. Urban Forest Strategy Annual Reporting Program.
Phase 1 and 2	Increase Council's ability to protect trees from vandalism.	Explore additional opportunities to minimise vandalism, particularly along the foreshore. Consider the preparation of a communications and engagement strategy targeted to private property owners and the wider community.	Local Laws, Open Space	Year 1 to 3	Budget and resources will be required to explore opportunities.	Utilise engagement evaluation matrix to measure success.
Phase 2	Provide safer and cleaner streets for our residents and visitors	As tree and vegetation cover increases with time, ensure future maintenance contracts appropriately funds the clean-up of tree leaves and debris on streets and public land.	City Asset, Open Space	Year 5 to 10	Additional budget may be required for maintenance contract.	The number of requests for additional service.
Phase 1	Strengthen requirements and advocacy to maintain and increase vegetation on private land.	Prepare Planning Scheme Amendments to strengthen the protection of vegetation on private land.	Development Services, Urban Strategy	Year 1 to 5	Planning Scheme Amendment process to be funded via operation budget. Budget may be required to prepare detailed background information.	Adoption of Planning Scheme Amendments

Phase	Objective	Action	Responsibility	Timeframe	Resources required	Measure
Phase 1	Identify open space areas that can be rezoned to the Public Conservation and Resource Zone (PCRZ), with reference to any existing or former Ecological Vegetation Communities on the sites.	Rezone the Highett Grassy Woodland from Public Park and Recreation Zone (PPRZ) into the Public Conservation Resource Zone (PCRZ) to promote and protect biodiversity within these areas.	Urban Strategy, Open Space	Year 1 to 5	Operational Costs.	Adoption of Masterplans and Planning Scheme Amendments

Appendix 1: Guiding Principles and Considerations

Council is responsible for the management of road reserves, parks, public spaces, and foreshore reserves and has an active tree planting and maintenance program, which is guided by the *Park and Street Tree Management Policy*. As such, Council has a greater degree of control and influence over the tree population on council-owned and managed land.

Planting in streets and parks presents a variety of challenges, and there are important principles to be utilised to overcome these challenges and increase and enhance Bayside's tree and vegetation cover. A complete and expanded set of these principles is included in the *Street and Park Tree Selection Guide* 2016 and should be referred to when designing or planting any streetscape. Examples of the below principles being utilised in street and neighbourhood settings are also provided within this Section of the Precinct Plans.

Highett has a distinctive character dominated by native and local indigenous species. Future plantings should focus on increasing the presence of indigenous species.

Planting types and locations in streets

1. Large canopy trees

A single large canopy tree provides greater benefits in terms of cooling, rainwater interception and other ecosystem services than multiple small trees totalling the same canopy extent. Prioritise the use of large canopy trees, with larger trees planted preferentially in centre medians or tree islands, then in the roadway and then the footpath.

We recognise that there are restrictions where medium or small size trees would be more appropriate due to competing infrastructure. Understorey planting in these locations is also encouraged.

2. Constrained planting spaces

- a.) Cut-outs. Planting in cut-outs in the road or footpaths provides a useful alternative where there may be insufficient space on the nature strip. Suitability for planting in the road or footpath will depend on road or footpath width and other factors such as traffic volume and impact to on-street parking.
- b.) Planting in Road Reserve. Designing in-road tree pits where there is opportunity to plant trees in between on-street parking spaces, traffic islands and buffer areas like street corners.
- c.) Narrow Streets. Narrow streets, including narrow footpaths and no nature strips, are best landscaped via tree planting within the parking lanes to either side, although this is partly limited by the need to maintain car parking spaces.

3. Roundabouts

Roundabouts will be considered as opportunities to plant canopy trees and understorey planting where appropriate. New plantings must not affect sight lines, safety or accessibility for larger vehicles. To ensure future planting is appropriate a Road Safety Audit will be completed before and after installation.

4. Boulevards

For boulevards, consider inter-planting with large canopy trees and shrubs to enhance the existing canopy cover.

5. Streets and powerlines

- a.) Residential streets. Low voltage overhead wires are present on one side of most residential streets. Where medians exist for large canopy tree planting, small to medium trees on the side with overhead constraints should be selected, always prioritising understorey planting.
- b.) Streets with small nature strip and powerlines: In streets that have small or very small nature strips, a smaller growing tree will be considered for the powerline side of the street. In those circumstances, the trees on both sides of the street should have similar foliage and form to provide a consistent theme for the street.
- c.) Tree pruning: In streets where footpath trees provide the only canopy, medium to large trees that can be effectively pruned around powerlines should be selected.
 - Street and park tree selection for trees growing under powerlines will consider the species' tolerance for pruning. For example, a tree that has a natural branching habit and a good wound response to mechanical damage would be considered an appropriate tree for growing under powerlines.
- d.) Underground powerlines: Although overhead powerlines are typically more economical, they are susceptible to damage from windborne tree branches, debris, and high wind conditions from extreme weather.

Council will facilitate the negotiations between the residents and relevant authorities to support the undergrounding of powerlines (and other services) if there is sufficient interest in a street.

6. Planting patterns and species choice

Highett's urban forest character is strongly connected to gum trees, and there will continue to be a higher population of gum trees in Highett. In terms of opportunities to increase diversity in streets, kerb out stands, roundabouts and road ends should be considered as opportunities to plant species drawn from a wider palette that are unique to the location or intersection and provide visual interest. These areas should also be considered as opportunities to create landmark feature landscapes and to support understorey planting.

7. Important Facades

In streets with important public buildings or building that have heritage importance, deciduous trees should be given preference so that building façades are exposed over winter.

The convention of planting avenues, or consistent lines of a single species, can limit species diversity. However, avenue plantings are important to local character in many streets and open spaces. To balance these two conflicting pressures, it is important to identify ways to minimise the extent of homogeneous avenue planting while maintaining a strong design outcome.

8. Selection criteria for street trees:

The following factors can be considered for selection of suitable street tree species:

- Relationship with local landscape character
 - o garden character, surrounding streetscape
 - o vegetation protection overlays, heritage values
 - maintain existing landscape character by selection of low fruiting cultivators where possible
 - Replacing difficult to replace existing species with species demonstrating similar characteristics, e.g. growth habit, foliage colour and size.
- Ability to tolerate and thrive in a site's environmental conditions. Species that have or can adapt to local conditions like climate, soil, coastal and salt tolerances, pests and diseases.
- Possible future damage to infrastructure as assessed against identified current issues with footpaths, kerb and channel, roadways, private infrastructure and powerlines.

9. Permeable surfaces

Impermeable surfaces such as pavements, roofing and building coverage increase the risk of flooding in urban areas. Comparatively, permeable surfaces are made of porous materials that allow stormwater to flow though, which reduces the volume of stormwater runoff that enters the drainage system. This helps improve water quality as it reduces the number of pollutants that enter waterways and habitats.

For new private residential development, at least 20% of the site should have surfaces that can absorb water such as lawns, garden beds or permeable paving. Council has developed the *Integrated Water Management Plan* 2019 – 2039, called 'Water for Bayside', to provide clear direction to deliver high priority integrated water management and water sensitive urban design (WSUD) activities. A key technique to improve water management is to increase permeability and incorporate WSUD into new developments and council projects.

Appendix 2: Case Studies

The following case studies showcase high-quality landscaping that combines the use of indigenous and native vegetation and high-quality design. A precinct's landscape helps define its character in much the same way as architecture or urban design because trees and other vegetation physically define a place. Landscapes are the setting for many everyday recreational and leisure activities and help forge a sense of connection to place.

Importance of high-quality landscaping to contribute to the urban forest

A precinct's landscape helps define its character in much the same way as architecture or urban design because tree and understorey vegetation can physically define a place. Landscapes are the setting for many everyday recreational opportunities such as organised sport, walking or having a picnic and therefore help forge a sense of connection to place.

1. Worthing Road/Wickham Road

The following case study provides an exceptional example of how residents can increase understorey vegetation cover on their nature strips. This example shows a diversity of indigenous and native grasses and shrubs surrounding a canopy tree, which provides a habitat for native fauna, allowing wildlife to move freely throughout Highett.

2. Worthing Road

The following example shows a nature strip densely planted with shrubs. The issue however is the inclusion of *Agapanthus* plants. *Agapanthus* are a threat to indigenous and native flora as they spread easily and form dense stands, causing them to become the dominant species wherever they grow, leading to the loss of other biodiversity. A great alternative to *Agapanthus* is the Spreading *Flax-lily*. The Spreading *Flax-lily* is an indigenous plant which also has purple flowers.

3. Tibrockney Street

The following case study showcases small grass shrubs planted around the base of a canopy tree.

Appendix 3: Highett Species Palette and Planting Targets

Species Targets

A broad target for Council's future planting has been set for native, indigenous and exotic species based on the vegetation character of each precinct. These targets should only be utilised as a guide to Council's Capital Works and Open Space teams for new and replacement planting in each suburb. While is important to strive towards these targets and diversify the urban forest, species should also be picked based on their ability to survive in certain locations, their contribution to neighbourhood character and the community's safety as well as their ability to provide improvement of habitat.

Suburb	EVCs	Target % of new Exotic Species plants	Target % of new Native Species plants	Target % of new Indigenous Species plants
Highett	719	30	30	40

Species Palette

The following species provided are of guidance only, and do not exclude other trees that are consistent with the character of Highett, the Guiding Principles and the Planting Plan. The Ecological Vegetation Class (EVC) that exists in Highett has informed the species palette as this class provides an indication of what native canopy species should be prioritised within the precinct. The EVC found in Highett is Damp Sands Herb-rich Woodland / Grassy Woodland (719). The key species associated with this EVC is provided in the tables below. By prioritising the planting of the listed species, the emphasis will be given on restoring native vegetation, to replicate the original vegetation of the area.

Eucalyptus, Banksia and other species are key genera across Highett, forming an important part of the character of the suburb's urban forest. Species from many other genera will also be planted to increase the diversity of tree species, with the aim to reduce the vulnerability of Highett's urban forest. The prepared species palette for Highett seeks to enhance the already diverse urban forest while also ensuring the species are complimentary to the EVCs found within the suburb. A high diversity of plant species improves the chance of local ecosystems to survive destructive events or processes such as weed and pest animal invasion and climate change. Planting of specific species will depend on the geographic and environmental conditions, as well as the surrounding neighbourhood character.

Bayside City Council has also developed the *Live Bayside Plant Bayside* 2022 as a guide to inform all future planting on public and private land. Residents are encouraged to use the guide in conjunction with the Highett Species Palette when undertaking planting on their private properties. The *Live Bayside Plant Bayside* Guide features a selection of plants including:

- Herbs and groundcovers
- Creepers and climbers
- Lilies, grasses and tussocks
- Small shrubs
- Large shrubs
- Trees.

Council promotes the use of indigenous plants as they occur naturally within Bayside and have adapted to the conditions within the local environment such as soil and climate. Please note, all indigenous plants provide habitat and food for local birds, insects, and other native animals.

General Planting List for Highett

The following species are provided as guidance only and should be considered for planting on private and public land where the following doesn't apply:

- One of the EVC species list identified in this Appendix;
- An existing approved landscape plan
- Endorsed Master plan for a Park or Reserve.

The list uses letter to denote the type of environment the species are suited to:

- A plants are adaptable, growing well in most soil types and aspects
- C plants are for the coast dune scrub and and woodland
- D plants prefer dry, well-drained soils and can tolerate dryness once established
- S plants prefer or tolerate full shade
- H plants prefer heath or woodland
- W plants prefer or tolerate moist soils, wetness and periodic inundation.

Climbing Plants		
Species Name	Common Name	Key
Billardiera mutabilis	Common Apple-berry	НА
Clematis microphylla	Small-leaved Clematis	HCA
Comesperma volubile	Love Creeper	HDS

Olearia glutinosa	Sticky Daisy-bush	CD
Ozothamnus ferrugineus	Tree Everlasting	HWA
Pomaderris paniculosa	Shining Coast Pomaderris	CDA
Ricinocarpos pinifolius	Wedding Bush	HW
Solanum laciniatum	Large Kangaroo Apple	HCA
Viminaria juncea	Golden Spray	HA

EVC Specific Lists

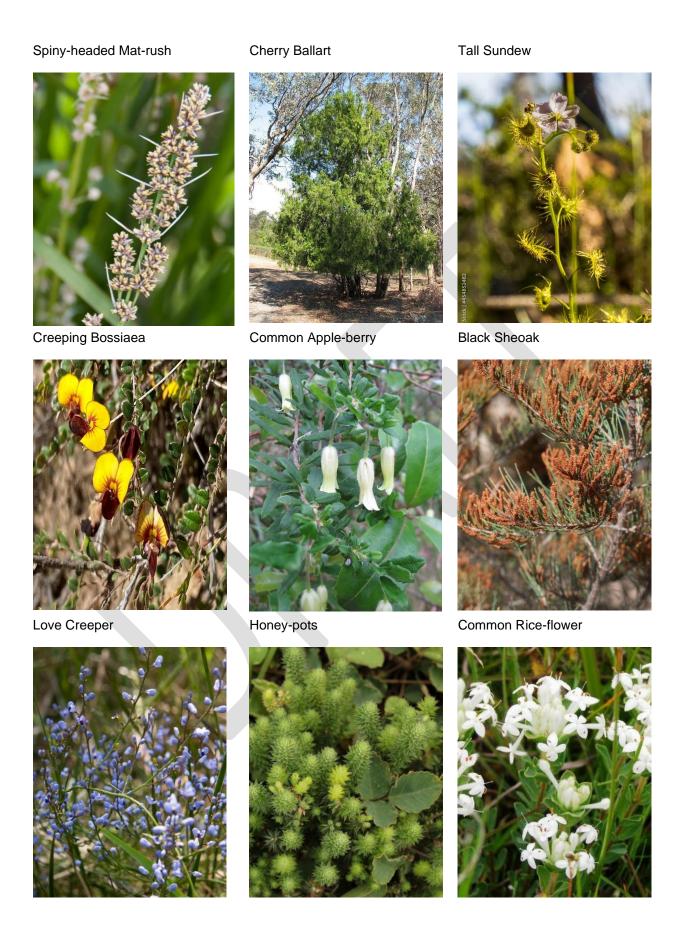

Of the 10 EVCs modelled within Bayside, one has been identified within Highett, the Damp sands herb-rich woodland / Grassy woodland EVC. The below species should be planted within the locations where these EVCs were historically present (as per Map 10).

Damp sands herb-rich woodland / Grassy woodland (EVC 719)

Reference Location: Donald Macdonald Reserve

Species typical of at least part of EVC range	Common Name	Lifeform	Location
Acacia mearnsii	Black Wattle	Middlestorey Tree	Throughout
Acacia melanoxylon	Blackwood	Middlestorey Tree	Inland Areas
Epacris impressa	Common Heath	Middlestorey Shrub	Heathlands
Leptospermum continentale	Prickly Tea-tree	Middlestorey Shrub	Throughout
Banksia marginata	Silver Banksia	Middlestorey Tree	Heathlands
Leptospermum myrsinoides	Heath Tea-tree	Middlestorey Shrub	Heathlands
Leucopogon virgatus	Common Beard- heath	Middlestorey Shrub	Heathlands
Dillwynia glaberrima	Smooth Parrot-pea	Middlestorey Shrub	Heathlands
Amperea xiphoclada var. xiphoclada	Broom Spurge	Understorey Shrub	Heathlands
Astroloma humifusum	Cranberry Heath	Understorey Shrub	Heathlands
Gonocarpus tetragynus	Common Raspwort	Understorey Herb	Heathlands
Drosera peltata subsp. auriculata	Tall Sundew	Understorey Herb	Inland Damp Areas
Viola hederacea sensu Willis (1972)	Ivy-leaf Violet	Understorey Herb	Inland sheltered sites
Geranium solanderi s.l.	Austral Cranesbill	Understorey Herb	Not local to BCC

Pimelea humilis	Common Rice-flower	Understorey Shrub	Coastal and Heathland Areas
Hibbertia riparia	Erect Guinea-flower	Understorey Shrub	Heathlands
Bossiaea prostrata	Creeping Bossiaea	Understorey Shrub	Coastal and Heathland Areas
Acrotriche serrulata	Honey-pots	Understorey Herb	Dry Sandy Areas
Pterostylis longifolia s.l.	Tall Greenhood	Understorey Herb	Inland sheltered sites
Drosera whittakeri subsp. aberrans	Scented Sundew	Understorey Graminoid	Heathlands
Deyeuxia quadriseta	Reed Bent-grass	Understorey Graminoid	Woodland Areas
Xanthorrhoea minor subsp. lutea	Small Grass-tree	Understorey Graminoid	Heathland and Woodland Areas
Lomandra longifolia	Spiny-headed Mat- rush	Understorey Graminoid	Coastal and Inland Damp Areas
Gahnia radula	Thatch Saw-sedge	Understorey Graminoid	Inland Damp Areas
Lomandra filiformis	Wattle Mat-rush	Understorey Graminoid	Inland Damp Areas
Themeda triandra	Kangaroo Grass	Understorey Graminoid	Inland Areas
Lepidosperma laterale	Variable Sword- sedge	Understorey Graminoid	Coastal and Woodland Areas
Pteridium esculentum	Austral Bracken	Understorey Fern	Heathland and Woodland Areas
Comesperma volubile	Love Creeper	Understorey Climber	Heathland and Woodland Areas
Billardiera scandens	Common Apple-berry	Middlestorey Tree	Coastal and Heathland Areas
Eucalyptus viminalis subsp. pryoriana	Rough-barked Manna Gum	Canopy Tree	Woodland Areas

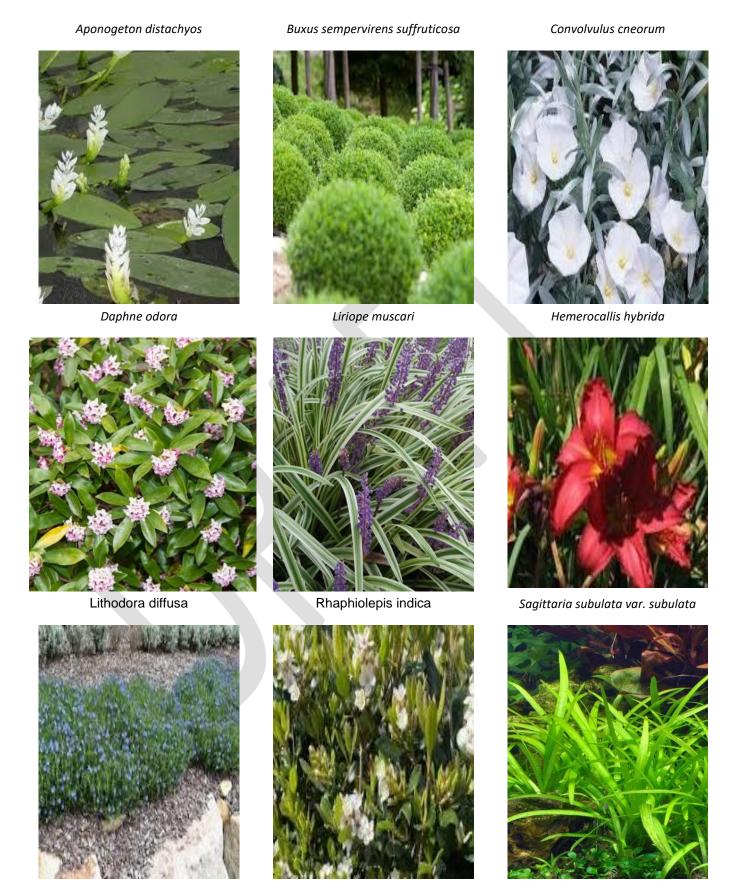

Exotic Species list

As reiterated in this Precinct Plan, focus will be placed on increasing the use of native and indigenous species. In certain areas of Bayside, the historic use of exotic plants makes part of the character of the area and has provided species diversity. The use of exotic plants is encouraged where appropriate and where considered to have a positive impact on the surrounding environment and neighbourhood.

Glossary

Biodiversity: 'All components of the living world: the number and variety of plants, animals, and other living things (including fungi and micro-organisms) across our land, rivers, coast, and ocean. It includes the diversity of their genetic information, the habitats and ecosystems within which they live, and their connections with other life forms and the natural world'.⁸

Canopy cover is the layer formed by the branches and crowns of plants or trees. The cover can be continuous, as in primary forests, or discontinuous - with gaps as in an urban area. Canopy is defined in Living Melbourne as vegetation above three metres in height.⁹

Canopy tree: A tree which has, or at maturity is likely to have, sufficient height and canopy characteristics to make a positive contribution to local amenity, sense of place, micro climate and/or biodiversity. Minimum 8 x 4 metres.¹⁰

Climate change refers to a change in the state of the climate that can be identified (e.g., by using statistical tests) by changes in the mean and/or the variability of its properties and that persists for an extended period, typically decades or longer.¹¹

Climate change adaptation is the process of adjustment to actual or expected climate and its effects. 12

Climate change mitigation is the human intervention to reduce the sources or enhance the sinks of greenhouse gases.¹²

Climate Emergency refers to the catastrophic changes to the climate brought about by human activity that poses a dangerous threat to all life on the planet.¹²

Environmentally Sustainable Development refers to development that is designed, constructed, and managed to optimise climate resilience, energy efficiency, integrated water management, indoor environment quality, the circular economy, low carbon transport and urban ecology.¹³

General Residential Zone (GRZ) is applied to land in areas where growth and housing diversity is anticipated. It is expected that the type of housing provided will evolve over time to provide more diverse forms of housing, but not at the expense of existing open garden character.¹⁴

Greenways are a form of landscape planning. They are linear open space corridors in the built or natural environment, which preserve biodiversity or other aspects of a sustainable environment, and generally engage the community in recreational use.¹⁵

Habitat: All the physical and biological things that collectively make up the place where a plant or animal lives.¹⁶

Habitat Corridor: A habitat corridor is a linear two-dimensional landscape element that differs from the surrounding vegetation, in both vegetation structure and form, and connects two or more patches, of otherwise isolated, habitat that have been connected in historical time, this is meant to function as a conduit for both plants and animals.¹⁷

Heat Vulnerability Index: The heat vulnerability index (HVI) is represented by a scale of 1 to 5 based on quintiles, with 1 representing low exposure, low sensitivity, or high adaptive capacity and 5 representing high exposure, high sensitivity or low adaptive capacity. We integrated indicators of heat vulnerability to calculate a Heat Vulnerability Index (HVI) at SA1 level. The index consists of three component layers: heat exposure, sensitivity to heat, and adaptive capability. Integration was accomplished by summing the scores from the three vulnerability components, dividing the SA1s into quintiles, and attributing SA1s with a Heat Vulnerability Rating scaled from 1 to 5.¹⁸

Neighbourhood Residential Zone (NRZ) is applied to land that has been identified as having specific neighbourhood, heritage, environmental or landscape character values that distinguish the land from other parts of the municipality or surrounding area.¹⁹

Permeability: The readiness with which a surface, whether man-made (such as a paved road) or natural (such as soil or rock) allows water, air or plant roots to penetrate or pass through.²⁰

Residential Growth Zone (RGZ) is considered a substantial change area where medium density housing growth and diversity of housing types is encouraged for example town houses and apartments around activity centres and close to train stations.²¹

Resilience: The capacity of individuals, institutions, businesses and systems within a city to adapt, survive and thrive no matter what kind of chronic stresses and acute shocks they experience.¹²

SEIFA: Socio-Economic Indexes for Areas (SEIFA) measures the relative level of socio-economic disadvantage and/or advantage based on a range of Census characteristics.²²

Senescence is the process by which cells irreversibly stop dividing and enter a state of permanent growth arrest without undergoing cell death.²³

Significant Landscape Overlay (SLO): The Significant Landscape Overlay (SLO) is a planning overlay and tool for protecting and managing significant landscapes. Its purpose is to identify significant landscapes, and conserve and enhance their character. The SLO can require a permit to

construct a building or construct or carry out works, construct a fence, and remove, destroy or lop any vegetation.²⁴

Significant Tree: Some trees, through age, size, and rarity of planting or association with historical events achieve a higher level of importance on private or public land. Identifies the following the categories used to define significant trees as scientific, social, historic, and aesthetic.²⁵

Tree Canopy: The uppermost trees or branches of trees in a forest, forming an almost continuous layer of foliage. The topmost layer of bioactivity in a forest setting.⁵

Urban Forest encompasses all of the Trees, Shrubs and Grasslands – and the Soil and Water that support them. An Urban Forest incorporates vegetation in streets, parks, gardens, plazas, campuses, river and creek embankments, coastal foreshores, wetlands, railway corridors, community gardens, green walls, balconies, and roofs.⁵

Urban Heat Island Effect: The phenomenon of dense urban areas having significantly warmer air and land surface temperatures than surrounding areas.⁵

Useful Life Expectancy (ULE): Assessment of useful life expectancy provides an indication of health and tree appropriateness and involves an estimate of how long a tree is likely to remain in the landscape based on species, stage of life (cycle), health, amenity, environmental services contribution, conflicts with adjacent infrastructure and risk to the community. It is not a measure of the biological life of the tree within the natural range of the species. It is more a measure of the health status and the tree's positive contribution to the urban landscape.³

Vegetation Protection Overlay (VPO): The VPO focuses on the protection of significant vegetation, including native and introduced vegetation in urban environments. The overlay can be applied to individual trees, groups of trees or areas of significant vegetation. It requires a landowner to obtain a permit to remove, destroy or lop any vegetation specified in a schedule to the overlay subject to a list of exemptions. Some of those exemptions apply to particular types of vegetation and others apply to specific situations, for example, to clear vegetation from electricity lines and to ensure emergency access.²⁶

Vulnerability: Exposure to contingencies and stress, and the difficulty in coping with them. This can apply to ecosystems, trees, people, and places.²⁷

Water Sensitive Urban Design (WSUD) is a more sustainable approach to urban planning and design to make use of stormwater and reduce the harm it causes to our natural waterways.²⁸
